

AMMENDUM

To calculate bacterial carbon productivity (BCP) I have incorrectly used the formula provided by Simon and Azam (1989) as follows:

$$BCP = L_{inc} \times 0.073 \times 131.2 \times 1 \times 0.86$$

This formula should read:

$$BCP = L_{inc} \times (100 / 7.3) \times 131.2 \times 1 \times 0.86$$

Therefore all of the BCP values reported in this thesis need to be multiplied by 187.65 to correct to true values. This does not affect the statistical results I have reported. It does, however, place BCP values in this study within the range of values previously reported in the literature and will be discussed accordingly in subsequent publications.
